

**GREAT LAKES UNIVERSITY  
UNIVERSITY OF KISUMU  
COURSE OUTLINE**

**SCHOOL:** Community Health & Development  
**DEPARTMENT:**  
**CAMPUS/SEMESTER:** Kisumu Campus/January-April 2026

**COURSE CODE/TITLE:** : BIostatistics

**COURSE LECTURER:** Christine Akinyi Odieny      **SIGNATURE:**  
**CONTACT:** [odienychristine42@outlook.com](mailto:odienychristine42@outlook.com)

**COURSE DESCRIPTION:** Basic statistical measurements of central tendency and dispersion, means, median, hypothesis testing, estimation, confidence intervals, correlation and regression analysis; Probability and Inference. Theoretical Distributions: The principles, assumptions, on Normal, Binomial and Poisson distributions. Sampling techniques: Determination of sample size: Sample size estimation for various types of studies; case-control, evaluative, cross-sectional, prospective, clinical trials studies. Hypothesis Testing: Null Hypothesis, Alternative Hypothesis: Level of confidence; Type I and Type II errors; Power of the Test; Confidence intervals; Testing the difference between two sample means and proportions; Chi-Square and Student t-test, McNamar's test. Regression: Multiple regressions, logistic regression, fitting of model to data, confidence intervals for regression line, interpretation of regression outputs, meaning of  $R^2$  Pearson coefficient. Analysis of variance: (ANOVA) Two-by-two tables, multi tables, assumptions, analysis, and interpretation of ANOVA tests.

**ELOs:** By the end of the course the learner will:

- i) Enhance understanding of statistical measures and inference through practical application and analysis.
- ii) Acquire a comprehensive knowledge of theoretical distributions through the study and application of their properties, characteristics, and statistical inference techniques.
- iii) Develop proficiency in sampling techniques and the determination of sample size, demonstrated through the

application of appropriate sampling methods and accurate sample size calculations in practical research scenarios.

- iv) Attain competence in hypothesis testing, regression analysis, and analysis of variance (ANOVA) through the successful application of these statistical methods in data analysis, interpretation of results, and drawing meaningful conclusions based on statistical inference.

| Week | Topic                                              | ELOs                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Sub-Topic                                                                                                                                                                                                                                                                                                                                                                  |

**ASSESSMENT STRATEGY:** Each week will consist of lectures, practical examples, and problem-solving sessions.  
Assignments and quizzes will be given to reinforce understanding and assess learning progress.  
End of Semester Examination

# ANOVA: a special regression analysis

## ■ Note:

- Analysis of variance is a special type of regression analysis.
- Most data sets for which analysis of variance is appropriate can be analyzed by regression with the same results.

# Module 10: Correlation & Regression

## Module Assignment

The course outline identifies correlation, regression,  $R^2$ , multiple regression and logistic regression, but the supplied PDF contains little dedicated teaching material on these topics. The assignment follows the requested clinical syllabus.

1. Using a clinical dataset, examine the relationship between age and systolic blood pressure (or two comparable numerical variables).
2. Create and interpret a scatter plot.
3. Calculate Pearson correlation and interpret its direction and strength.
4. Fit a simple linear regression model and report the equation, coefficient, p-value and  $R^2$ .
5. Explain why correlation does not establish causation and identify one possible confounder.

**Submission guidance:** Show working where calculations are required. Interpret statistical results in clinical language. Use Excel, Jamovi or SPSS where appropriate.
